# EE211 24Fall Lab2

1 Prepare your OS

**Content** 

2 ROS2

3 Learn Some Bash Commands

# **Prepare your OS - Local Machine**

For a better development experience, using a local ubuntu machine is recommended!

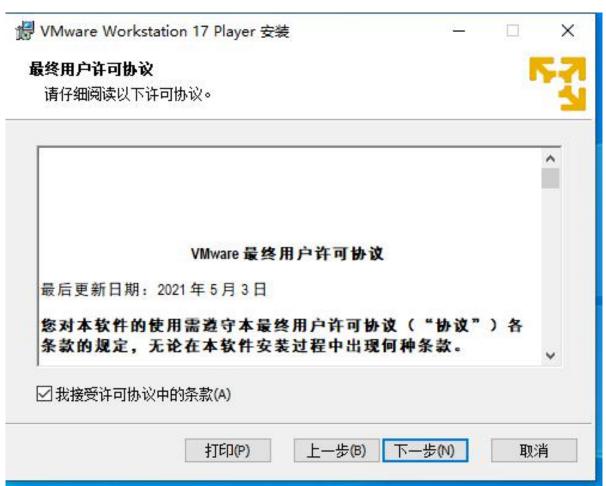

You may install a separate ubuntu os on your windows PC, so that you can using win and ubuntu on the same computer!

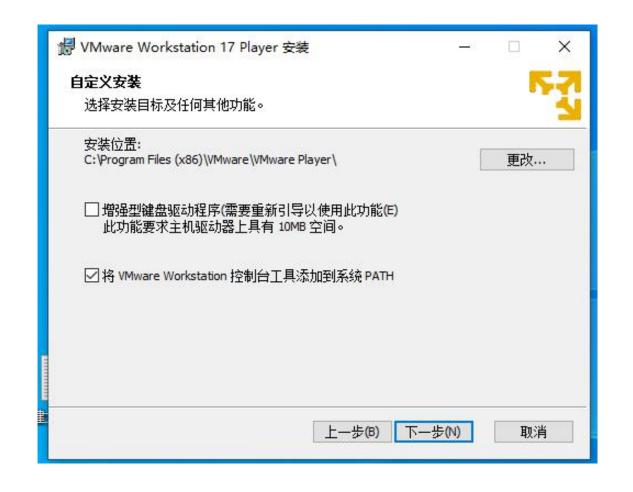

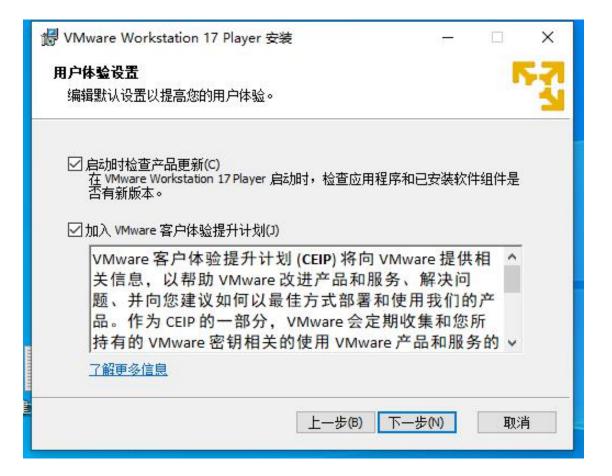

VMware Workstation Player - VMware Customer Connect

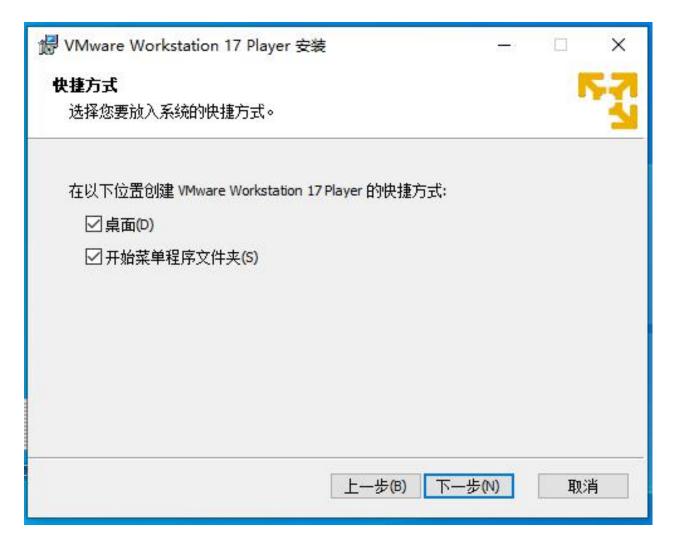

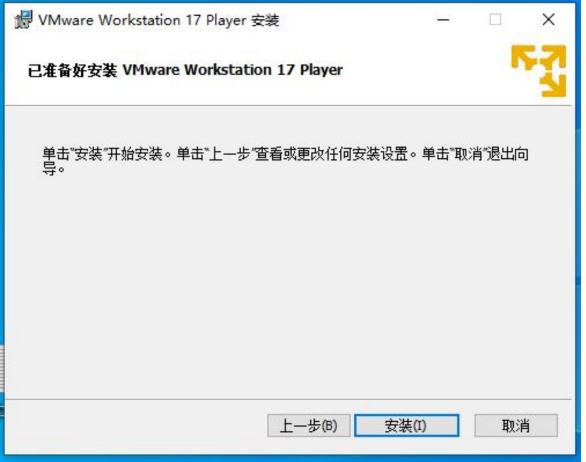

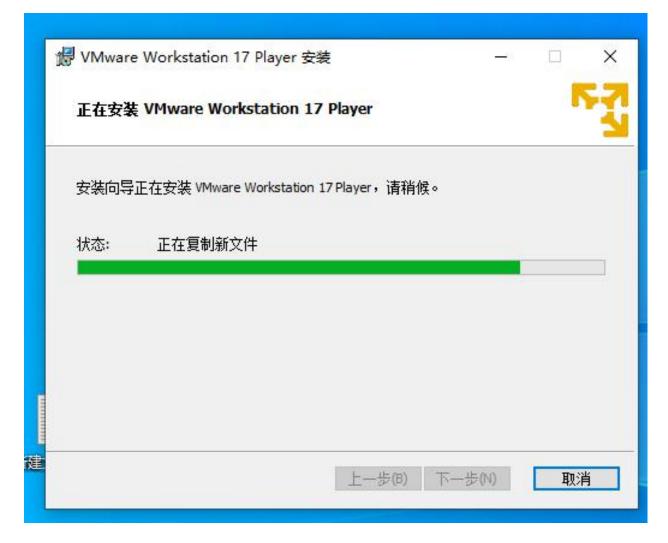

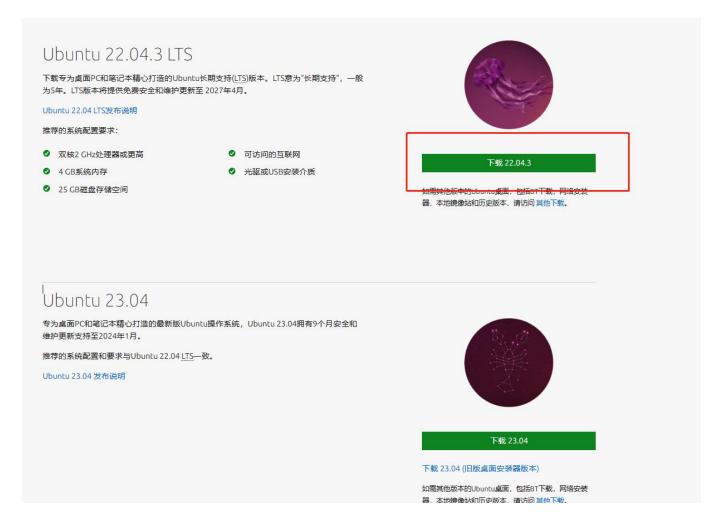

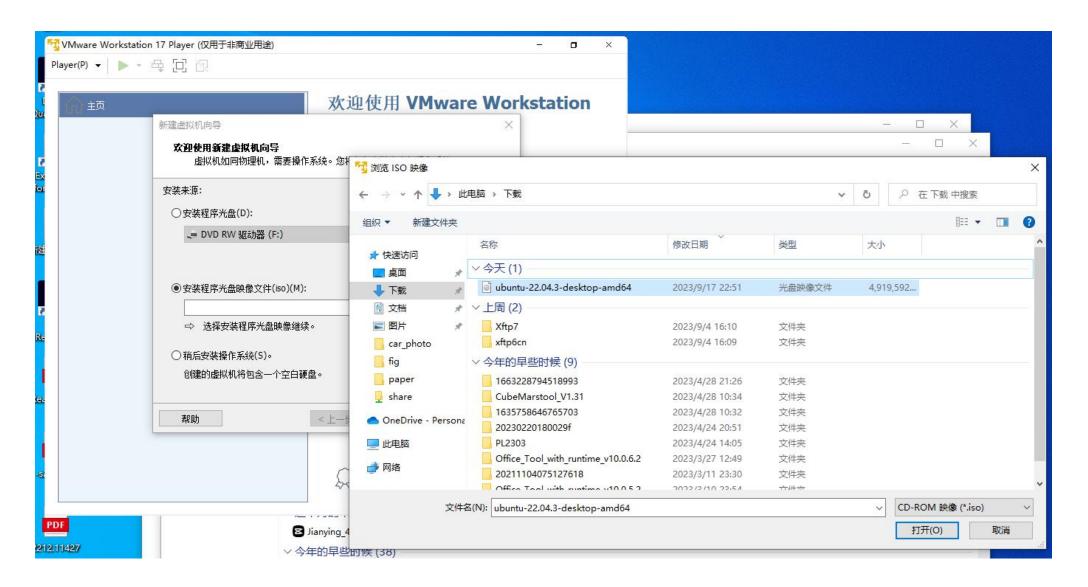

下载Ubuntu桌面系统 | Ubuntu

新建虚拟机向导
指定磁盘容量
磁盘大小为多少?
虚拟机的硬盘作为一个或多个文件存储在主机的物理磁盘中。这些文件最初很小,随着您 向虚拟机中添加应用程序、文件和数据而逐渐变大。
最大磁盘大小 (GB)(S): 40,0 ♣
针对 Ubuntu 64 位 的建议大小: 20 GB
〇 将虚拟磁盘存储为单个文件(O)
● 将虚拟磁盘拆分成多个文件(M)
拆分磁盘后,可以更轻松地在计算机之间移动虚拟机,但可能会降低大容量磁盘的性
能。
帮助 < 上一步(B) 下一步(N) > 取消

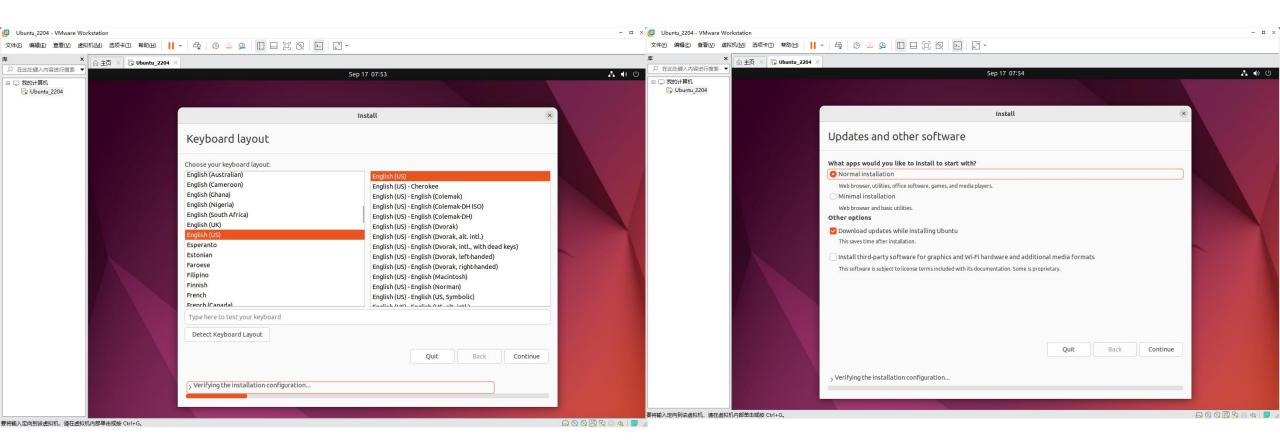

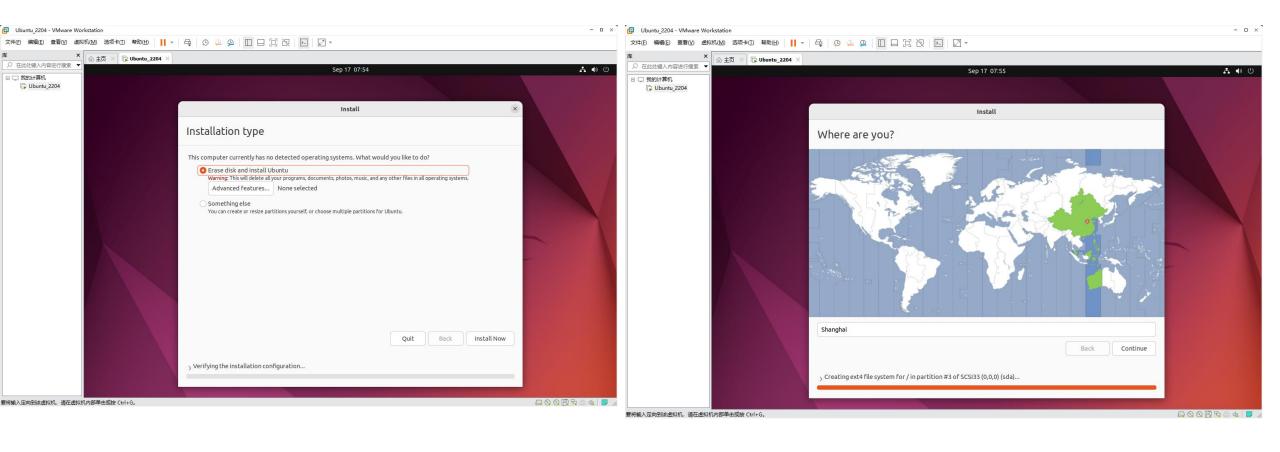

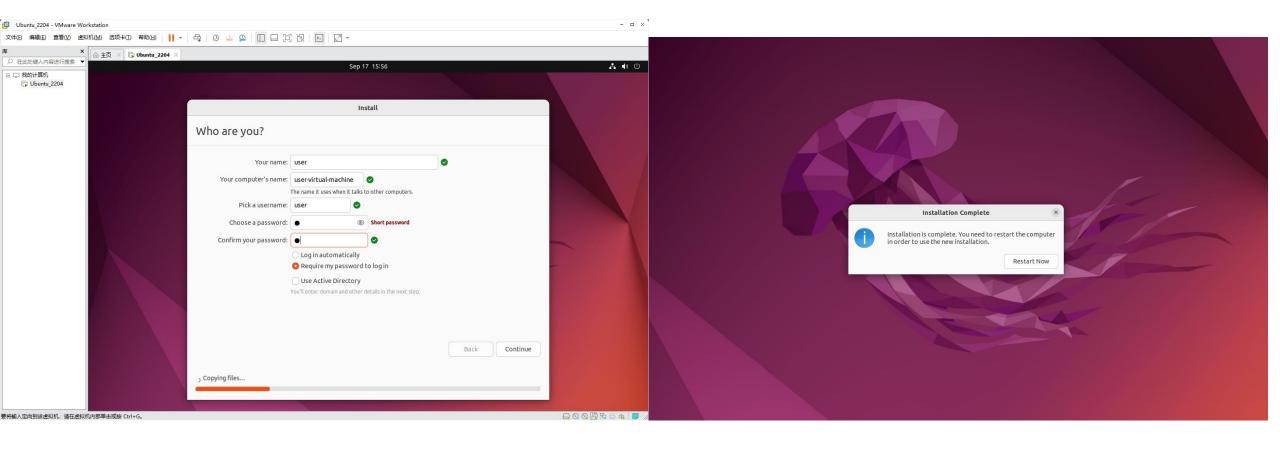

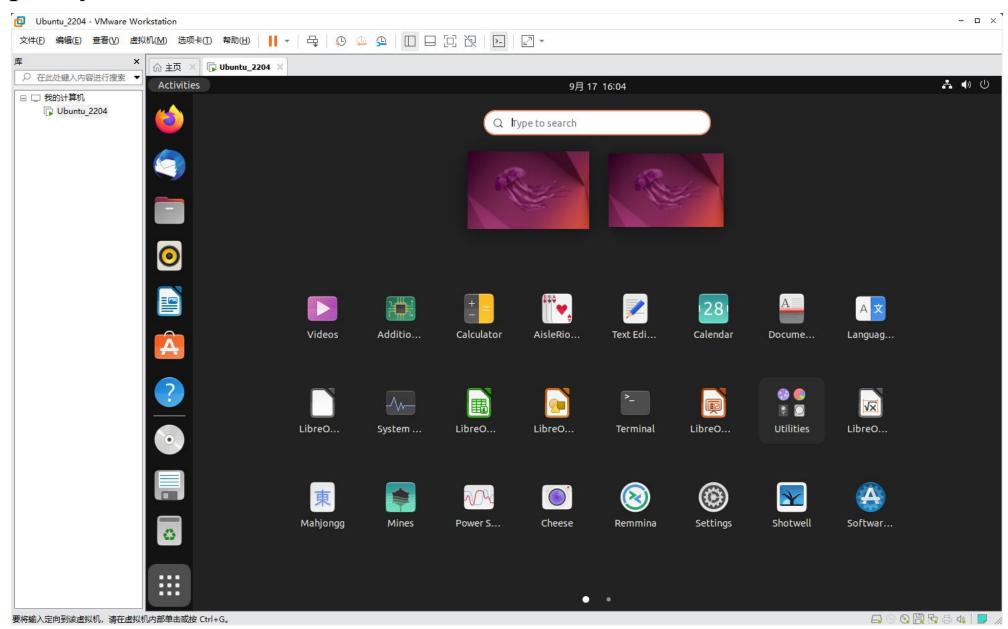

# For ROS2 Learning, reading and following the official documentation is HIGHLY RECOMMENDED!

https://docs.ros.org/en/humble/Tutorials.html

You can also follow the instructions in the next pages of slides, to achieve some demos with ROS2.

#### 1. Setting up Encoding

```
$ sudo apt update && sudo apt install locales
```

- \$ sudo locale-gen en\_US en\_US.UTF-8
- \$ sudo update-locale LC ALL=en US.UTF-8LANG=en US.UTF-8
- \$ export LANG=en US.UTF-8

#### 2. Setting apt source (https://mirror.tuna.tsinghua.edu.cn/help/ros2/)

\$ sudo apt install curl gnupg2

\$ sudo curl -sSL https://raw.githubusercontent.com/ros/rosdistro/master/ros.key -o /usr/share/keyrings/ros-archive-keyring.gpg

\$ sudo echo "deb [arch=\$(dpkg --print-architecture) signed-

by=/usr/share/keyrings/ros-archive-keyring.gpg]

https://mirrors.tuna.tsinghua.edu.cn/ros2/ubuntu jammy main" | sudo tee

/etc/apt/sources.list.d/ros2.list > /dev/null

\$sudo apt update

\$sudo apt upgrade

#### 1. Install

\$ sudo apt install ros-humble-desktop

\$ sudo apt install python3-colcon-common-extensions python3-argcomplete python3-rosdep

\$ sudo apt install git

\$ echo " source /opt/ros/humble/setup.bash" >> ~/.bashrc

#### 2. Uninstall

\$ sudo apt remove ros-humble-\*

\*

\$ wget http://fishros.com/install -O fishros && . fishros

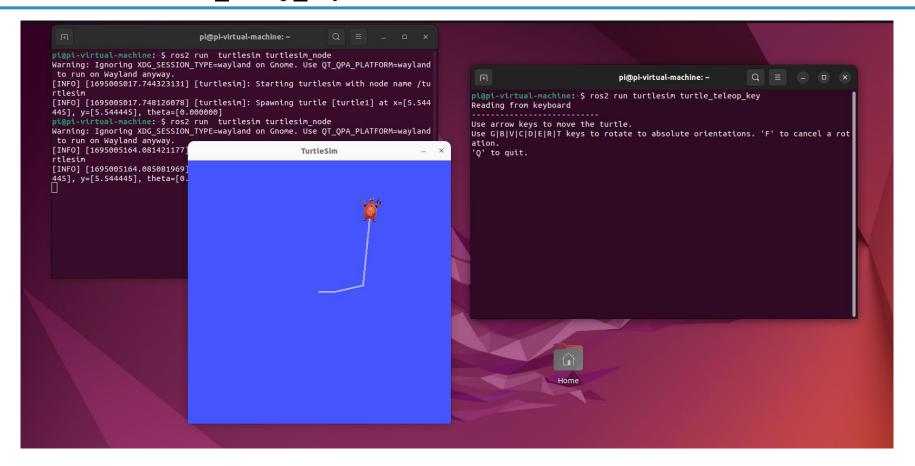

#### 1. Run first ROS2 node

\$ ros2 run turtlesim turtlesim node

\$ ros2 run turtlesim turtle teleop key

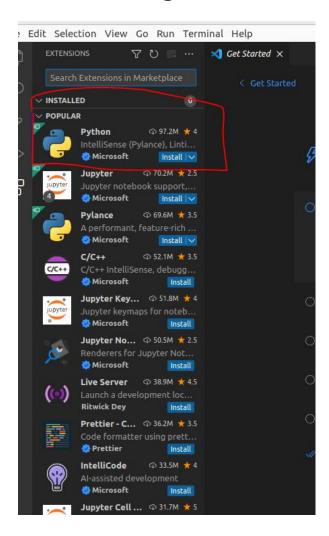

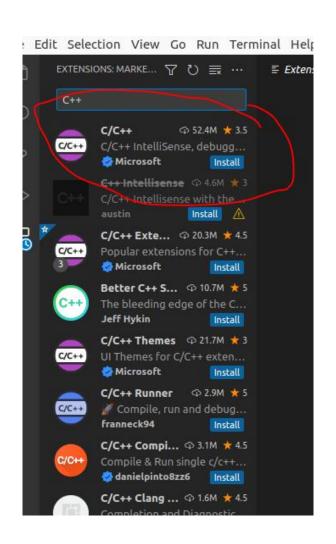

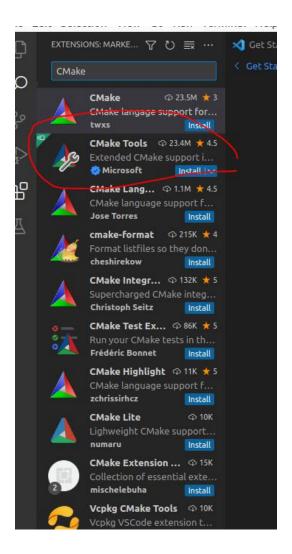

#### **VScode Setting**

#### **Common command operations**

```
cd <dir>
mkdir [option] <dir>
cp [option] <source> <target>

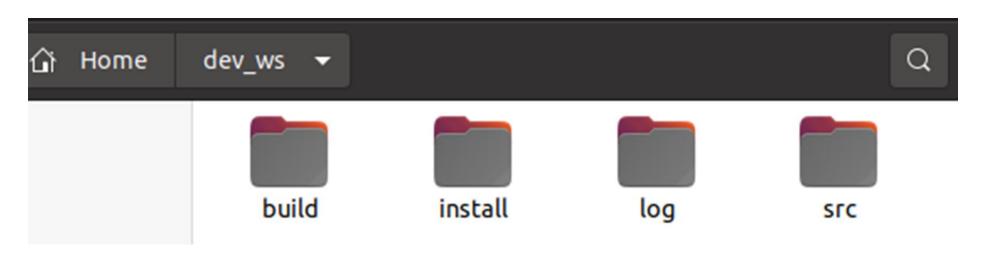

rm [option] <file/dir...>
```

```
pi@pi-virtual-machine:-/Desktop$ ros2 --help
usage: ros2 [-h] [--use-python-default-buffering]
            Call `ros2 <command> -h` for more detailed usage. ...
ros2 is an extensible command-line tool for ROS 2.
options:
  -h, --help
                        show this help message and exit
  --use-python-default-buffering
                        Do not force line buffering in stdout and instead use
                        the python default buffering, which might be affected
                        by PYTHONUNBUFFERED/-u and depends on whatever stdout
                        is interactive or not
Commands:
 action
            Various action related sub-commands
            Various rosbag related sub-commands
  bag
  component Various component related sub-commands
            Various daemon related sub-commands
             Check ROS setup and other potential issues
  interface Show information about ROS interfaces
            Run a launch file
 lifecycle Various lifecycle related sub-commands
 multicast Various multicast related sub-commands
  node
            Various node related sub-commands
  param
            Various param related sub-commands
            Various package related sub-commands
  pkg
            Run a package specific executable
            Various security related sub-commands
  security
  service
            Various service related sub-commands
  topic
            Various topic related sub-commands
  wtf
            Use `wtf` as alias to `doctor`
  Call `ros2 <command> -h` for more detailed usage.
```

#### WorkSpace

### **Create WorkSpace**

\$ mkdir -p ~/dev\_ws/src

\$ cd ~/dev\_ws/src

\$ git clone https://gitee.com/guyuehome/ros2\_21\_tutorials.git

#### 1.Installing dependencies

```
$ sudo apt install -y python3-pip
```

- \$ sudo pip3 install rosdepc
- \$ sudo rosdepc init
- \$ rosdepc update
- \$ cd ..
- \$ rosdepc install -i --from-path src --rosdistro humble -y

#### 2.Building

```
$ sudo apt install python3-colcon-ros
```

- \$ cd ~/dev ws/
- \$ colcon build

#### 3.Source

\$ source install/local\_setup.sh

#### 1.Create your first package

```
$ ros2 pkg create --build-type <build-type> <package name>
```

<bul><build-type>

C/C++: ament\_cmake

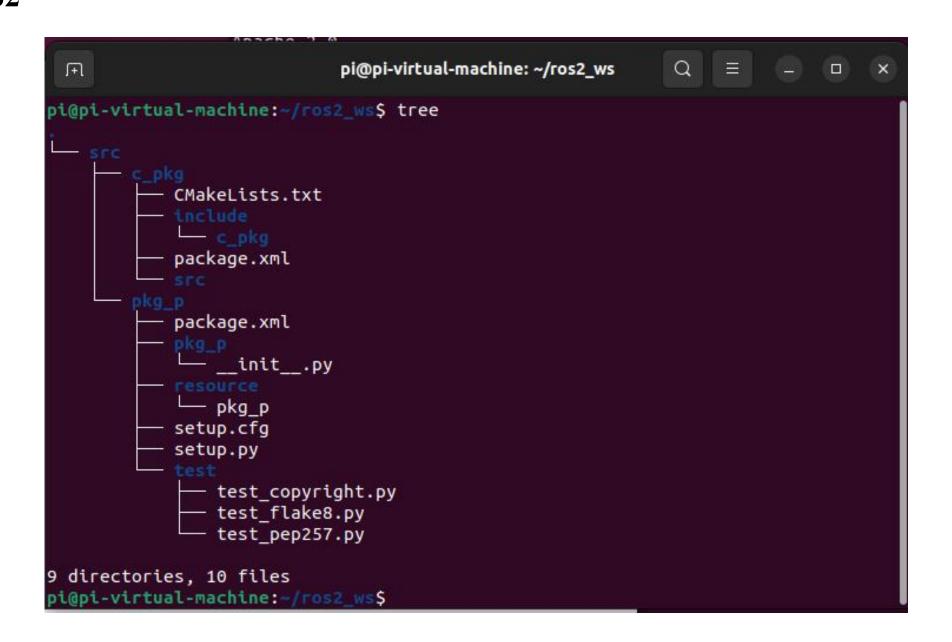

Python: ament\_python

\$ cd ~/dev ws/src

\$ ros2 pkg create --build-type ament\_cmake c\_pkg --dependencies rclcpp std\_msgs

\$ ros2 pkg create --build-type ament\_python pkg\_p --dependencies rclpy std\_msgs

```
